## Instructions:

1. **Download the Java-.jar-File at:**
   **https://www.mediafire.com/folder/5qvyz9eb03d7i/BFME-Windows-Resolution-Fixer**

   *Browsers like Google Chrome demand a security check.*
   *Don't worry, the program is virus-free, test it at https://www.virustotal.com/de/ if you are still uncertain.*

2. **Open the downloaded Java-.jar-File with Java Platform SE binary.**

   *If it is not in your list, you need to install the latest Java-version:*
   *https://www.java.com/en/download/*

3. **Choose your game by clicking through the tabs.**

4. **Choose the language in which you've installed the game and select your preferred resolution.**
   *Note:*
   - *Your current monitor-resolution is auto-selected.*
   - *Your preferred resolution should not be larger than your monitors resolution, because the game has no support for decimation[1] like NVIDIA DSR[2].*

[1] https://en.wikipedia.org/wiki/Decimation_(signal_processing)
[2] http://www.geforce.com/hardware/technology/dsr/technology

## 5. Apply changes

*A pop-up will appear (see figure).*

- *„Done! (Created: + Path)“ – The file did not exist before and has been generated .*
- *„Done! (Edited: + Path)“ – The file existed before and has been edited.*
- *Repeat Step 4 and 5 for every „Battle for Middle-Earth“-Game.*

## 6. Start the game

*Note:*

*If you have a computer with two graphics processing units you need to start the game with your dedicated GPU, in order to avoid game-crashes. (In this example: use the „High-performance NVIDIA processor“).*

*Hint:*

*If you want to manually patch the game, just go to my Mediafire-Folder:*
*https://www.mediafire.com/folder/s50wrxf0a7w0s/Patches_for_The_Battle_for_Middle-Earth-Trilogy*
