Instructions:

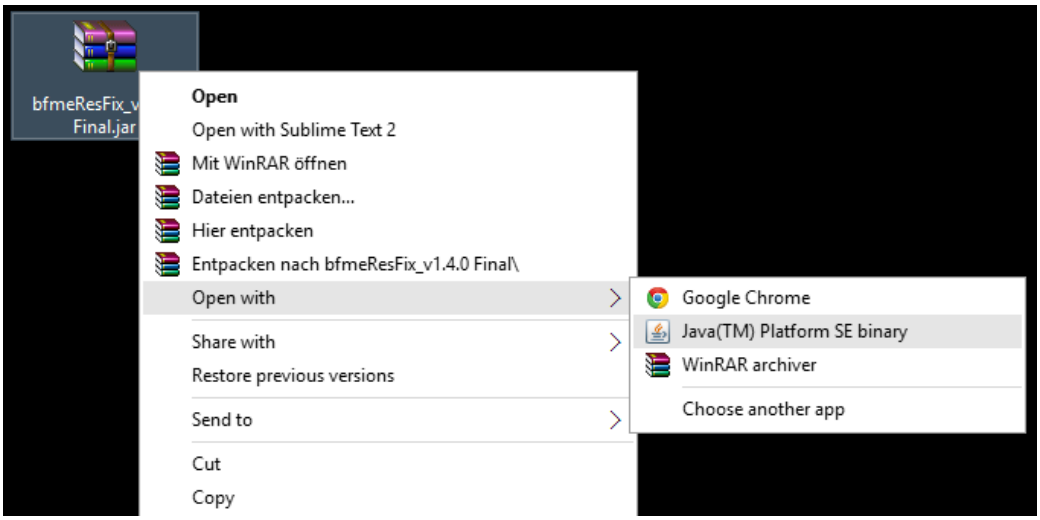
1. **Download the Java-.jar-File under:**

   https://www.mediafire.com/folder/5qvyz9eb03d7i/BFME-Windows-Resolution-Fixer

   
   Browsers like Google Chrome demand for a security check.
   Don't worry, the program is virus-free, test it at https://www.virustotal.com/de/ if you are still unsure.

2. **Open the downloaded Java-.jar-File with Java Platform SE binary.**

   If it is not in your list, you need to install the latest Java-version:
   https://www.java.com/en/download/

3. **Choose your game by clicking through the tabs.**

4. **Choose the Language in which you've installed the game and select your preferred resolution.**

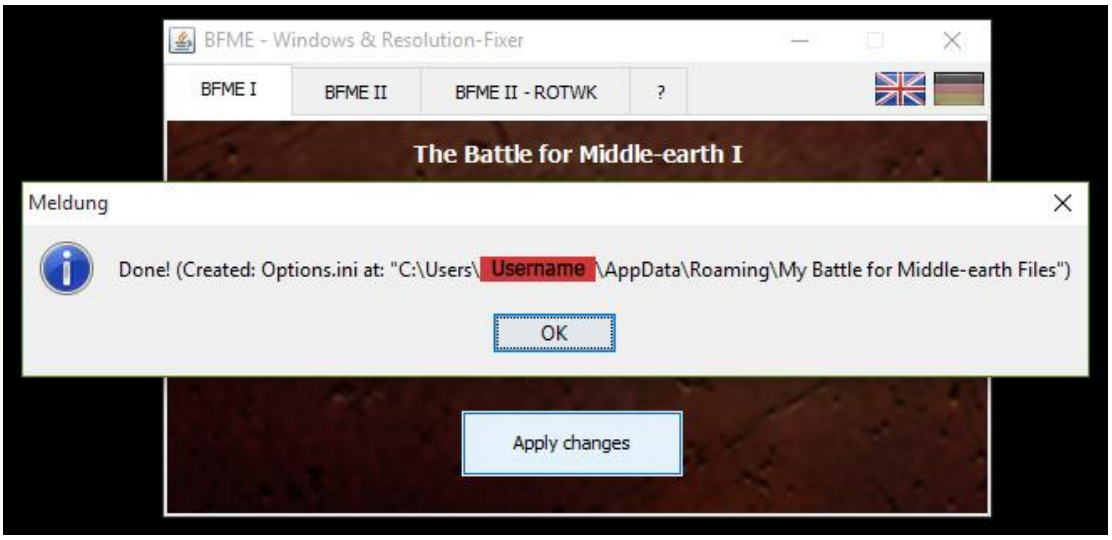
   Note:
   - *Your current monitor-resolution is auto-selected.*

- *Your preferred resolution should <u>not</u> be larger than your monitors resolution, because the game has no support for Decimation[1] like NVIDIA DSR[2].*

5. Apply changes

A pop-up will appear (see Figure).

- *„Done! (Created: + Path)“ – The file did <u>not</u> existed before and has been generated .*
- *„Done! (Edited: + Path)“ – The file existed before and has been edited.*
- *Repeat Step 4 and 5 for every „Battle for Middle-Earth“-Game.*



6. Start the game

Note:

If you have a computer with two graphics processing units you need to start the game with your dedicated GPU, in order to avoid game-crashes. (In this example: use the „High-performance NVIDIA processor“).

Hint:

If you want to manually patch the game, just go to my Mediafire-Folder:
https://www.mediafire.com/folder/s50wrxf0a7w0s/Patches_for_The_Battle_for_Middle-Earth-Trilogy

You need additional help? Send me an Email: MorgulLord29isback@gmail.com
